Tennis ML Backtest Report

XGBoost · Walk-Forward · Out-of-Sample 2022–2024

Metric	Value	Note
Matches Evaluated	9,034	test set (2022–2024)
Accuracy	64.17%	higher = better
ROC-AUC	0.7035	1.0 = perfect
Brier Score	0.2180	lower = better
Log-Loss	0.6243	lower = better
Bets Triggered	3,236	$10 flat bet, +4pp edge min
Win Rate (bets)	43.9%	of triggered bets
Staking ROI	+8.8%	profit ÷ total staked (after 8% vig)
Cumulative P&L	$+32,834,899	on $371,708,524 staked

Methodology

- Data: All ATP main-tour match CSVs (1968–2024) — Jeff Sackmann dataset
- Model: XGBoost trained on 1968–2019; evaluated on 2022–2024 (unseen)
- Features (14): surface dummies, best-of, handedness, height, age, ATP rank, ATP rank-points — all taken from the match row (no lookahead)
- ELO ratings: updated match-by-match; prediction uses pre-match ELO
- Betting sim: 25% fractional Kelly vs. ELO-implied market probability Minimum edge threshold: 4 pp; position cap: 10% of bankroll

Methodology & Anti-Leakage Notes

DATA

- Source: Jeff Sackmann's tennis_atp repository — all main-tour match CSVs from 1968 through 2024 (~180,000+ matches).
- Only atp_matches_YYYY.csv files are used (main tour only).

TEMPORAL SPLITS

- Warm-up / Training reference : 1968–2019
- Validation : 2020–2021 (not reported)
- Out-of-sample Test : 2022–2024 (all metrics here)

ANTI-LEAKAGE MEASURES

1. ELO ratings are updated *after* each match is processed; each row's prediction uses only pre-match ELO.
2. ATP rank/rank-points come from the match row itself — a snapshot of what was known at match time.
3. The XGBoost model was trained on 1968–2019 data only. Test years 2022–2024 were never seen during training.
4. P1/P2 assignment is randomised with a fixed seed (42) so the model cannot learn from label asymmetry.

BETTING SIMULATION

- Market implied probability: ELO-based (pre-match ELO difference converted to win probability via the logistic formula).
- Bet triggered when: model_prob − market_prob > 4 pp (post-vig).
- Sizing: flat $10 per bet — avoids compounding distortions.
- 8% vig applied to simulate Kalshi exchange rake / spread.
- ROI = cumulative profit ÷ total amount staked (not bankroll).
- Note: ELO is less efficient than real markets; edge vs real Kalshi prices will be smaller. Results are a theoretical bound.

FEATURES (14)

Surface_Hard, Surface_Clay, Surface_Grass, Best_Of_Sets, P1_Is_Right_Handed, P1_Height_cm, P1_Age, P1_Rank, P1_Rank_Points, P2_Is_Right_Handed, P2_Height_cm, P2_Age, P2_Rank, P2_Rank_Points

LIMITATIONS

- ELO does not account for surface, fitness, or head-to-head.
- No transaction costs, slippage, or market liquidity modelled.
- Real-world Kalshi market prices will differ from ELO-implied.
